2005 Noncitrus Fruit Utilized Production Up 3 Percent, Value Up 4 Percent

In 2005, the Nation's utilized production of the leading noncitrus fruit crops totaled 17.2 million tons, up 3 percent from the comparable 2004 utilized production. Utilized production increased from 2004 for cultivated blueberries, Maine wild blueberries, Oregon loganberries, Oregon black raspberries, red raspberries, tart cherries, cranberries, grapes, California kiwifruit, California olives, California plums, California prunes, and strawberries.

The value of utilized production for noncitrus fruit crops totaled 9.34 billion dollars, up 4 percent from 2004. The value of utilized production for California prunes increase 81 percent, nectarines increased 51 percent, California olives are up 28 percent, California plums increased 27 percent, and apricots are up 16 percent from the previous year. However, the value of utilized production for prunes and plums decreased 27 percent, California dates are down 14 percent, Hawaii papayas decreased 11 percent, tart cherries decreased 6 percent, strawberries are down 5 percent, and Hawaii pineapples decreased 5 percent from 2004.

Highlights

Utilized apple production for 2005 is estimated at 9.78 billion pounds, down 6 percent from the 2004 level. Utilized production for Washington and New York decrease 6 percent and 20 percent, respectively, while Michigan's utilized production increased 8 percent compared to the previous year. In New York, a spring frost during bloom, extreme heat during early summer, and heavy rains and winds during mid October reduced the 2005 crop. Below normal humidity levels in Michigan kept disease pressure low and the apple crop was ahead of normal development throughout the growing season.

Utilized grape production for 2005 totaled 6.97 million tons, up 12 percent from the 2004 crop. The California crop, which accounts for 88 percent of the 2005 U.S. utilized grape production, is up 9 percent from the previous year. Also for California, raisin type production rose 3 percent from 2004, wine type production increased 14 percent, and table type production is up 8 percent. Utilized production increased from 2004 in all grape estimating States except Arizona, Arkansas, and Texas.

Utilized peach production in 2005 is estimated at 1.14 million tons, down 7 percent from the previous year and 5 percent below 2003. The California crop, accounting for 76 percent of the U.S. utilized peach production, is down 6 percent from 2004. For California, the Clingstone peach estimate is down 10 percent and the Freestone estimate is down 1 percent from 2004.

Utilized pear production for 2005 is 811,670 tons, down 7 percent from the previous year. Washington, the top producing State, utilized 400,000 tons, up 9 percent from 2004. California, the second largest producer at 200,000 tons, is down 26 percent from the previous season. Utilized pear production in Oregon, the third largest producing State, is 196,000 tons, down 7 percent from 2004.

U.S. Nut Production Down 4 Percent, Value Up 22 Percent

The 2005 U.S. nut production is estimated at 1.46 million tons (in-shell basis), a 4 percent decrease from a year earlier. The almond crop totaled 775,900 tons, down 10 percent from 2004. Walnut production for 2005, at 355,000 tons, is up 9 percent from the previous year. The pistachio crop totaled 141,500 tons, 18 percent less than 2004. Pecan production for 2005 is estimated at 129,800 tons, a 40 percent increase from 2004. Hazelnut production, at 28,000 tons, is down 25 percent from the previous year. Macadamia production, at 30,000 tons, is up 6 percent.

The 2005 U.S. value of utilized nut production is estimated at 4.30 billion dollars, up 22 percent from the revised 2004 value. The almond crop is valued at 2.72 billion dollars, up 24 percent from 2004. Pistachio value for 2005, at 574 million dollars, is 24 percent greater than last year. The pecan crop showed a 22 percent increase in value, to 400 million dollars. Hazelnut value, at 57.1 million dollars, is 6 percent higher than the previous year. The macadamia value, at 46.8 million dollars, is up 13 percent.

Definition of Terms

Apples, Commercial Crop refers to orchards of 100 or more bearing age trees.

Bearing Acreage - An orchard, grove, or vineyard is considered bearing when it reaches an age when it can normally be expected to produce a commercially significant quantity of the crop. Bearing age is a function of many factors including variety, rootstock, year planted, etc. Bearing acreage is primarily based upon periodic orchard surveys. In non-survey years, bearing acreage is based on trends, county extension service data, end-of-year production surveys, and other indications.

Prices are a marketing year average for all methods of sale. For a crop sold for both fresh market and processing, the **Marketing Year Average Price (MYA)** is a weighted average of the fresh and processing price.

Prices for fresh fruit are the average prices producers receive at the point of first sale. This is commonly referred to as the **average price as sold**. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the proportionate quantity sold. For example, if in a given State part of the fruit is sold F.O.B. packed by growers, part is sold as bulk fruit at the packinghouse door, and some is sold retail at roadside stands, the fresh fruit **average price as sold** is a weighted average of the average price for each method of sale. The exception is fresh fruit sales in California, Washington, and New York (apples only) which are equivalent returns at packinghouse door. The equivalent packinghouse returns represent adjusted prices.

F.O.B. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the F.O.B. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for fruit sold for processing are equivalent returns for fruit delivered to the processing plant door except for cranberries, California olives, and clingstone peaches which are priced at the first delivery point.

Crop value estimates in this report cover the marketing season or crop year and should not be confused with cash receipts from these crops which are on a calendar year.

Total Production is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

Unutilized Production is the difference between total and utilized production which is marketable fruit not harvested for economic or natural reasons and harvested fruit not sold or utilized.

Harvested not sold is fruit of marketable quality that was picked but not sold for various reasons. Harvested not sold amounts up to 2 percent of total production are considered normal seasonal losses and are excluded from total production.

Unharvested Production is marketable fruit produced, but not harvested for various reasons. Unharvested amounts up to 2 percent of total production are considered normal seasonal losses and are excluded from total production.

Utilization refers to first utilization, not necessarily final utilization. For example, frozen fruit includes some fruit that may be later used for making preserves. Grade-outs for fresh market fruit which are processed are included in the processing quantity. Fruit graded-out from canning or freezing and utilized for juice is included with juice.

Utilized Production is the amount sold plus the quantities used at home or held in storage.

Yield per Acre is based on total production which includes unharvested production and fruit harvested but not sold due to marketing conditions.

State Value of Utilized Production and MYA Price Computations

The following procedure is used to compute State Values of Utilized Production and MYA Prices:

Fresh Market Value = Fresh Market MYA
 Times
 Fresh Market Utilization

Process Market Value = Process Market MYA
 Times
 Process Market Utilization

"All" Sales Value = Fresh Market Value
 Plus
 Process Market Value

"All" Sales MYA = "All" Sales Value
 Divided By
 "All" Sales Utilization

For commodities with components not identified by market channel, substitute breakdown name for fresh/processing market and use the same procedure.

U.S. MYA Price Computations

The following procedure is used to compute the U.S. MYA Prices:

Fresh Market MYA = Fresh Market Value For All States
 Divided By
 Fresh Market Utilization For All States

Process Market MYA = Process Market Value For All States
 Divided By
 Process Market Utilization For All States

"All" Sales MYA = Sales Value For All States

Reliability of January Noncitrus Fruit Production Estimates

Reliability: To assist users in evaluating the reliability of the January noncitrus fruit production estimates, the "Root Mean Square Error," a statistical measure based on past performance, is computed. The deviation between the first January production estimate and the final estimate is expressed as a percentage of the final estimate. The average of squared percentage deviations for the latest 20-year period is computed. The square root of the average becomes statistically the "Root Mean Square Error." Probability statements can be made concerning expected differences in the current estimate relative to the final end-of-season estimate, assuming that factors affecting this year's estimate are not different from those influencing recent years. For example, the "Root Mean Square Error" for the January apple production estimate is 3.0 percent. This means that chances are 2 out of 3 that the current production estimate will not be above or below the final estimate by more than 3.0 percent. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 5.2 percent.

Also, shown in the following table is a 20-year record for selected crops of the differences between the first January production estimate and the final estimate. Using apples again as an example, changes between the first January estimate and the final estimate during the last 20 years have averaged 114.6 thousand tons, ranging from 6.1 thousand tons to 398.9 thousand tons. The first January estimate has been below the final estimate 9 times and above 11 times. This does not imply that the January estimate this year is likely to understate or overstate the final production.

Prospering in Rural America

February 16-17, 2006
Crystal Gateway
Marriott Hotel
Arlington, Virginia

The theme is "Prospering in Rural America," and the program will highlight the economic development of rural America. In addition, there will be a broad range of sessions, including Shifting Trade Patterns, Chinese Agriculture, Homeland Security, the African Growth & Opportunity Act, Bio-fuel Production and New Energy Forms in Rural Areas, Community Supported Agriculture, and Feedback from the 2007 Farm Bill Listening Sessions.

Agriculture Secretary Mike Johanns and other top experts in agriculture will be among the more than 130 speakers.

Find full program and registration details at www.usda.gov/oce/forum or call toll free, 1-877-572-6043. Forum speeches can be downloaded after February 17, 2006.
